SysAid AI PM — Job Description Fit Analysis

Requirement-by-Requirement Match

REQUIREMENT	FIT	YOUR EVIDENCE / ACTION
5+ years PM in B2B SaaS	Needs clarity	How many years at Oqton and prior PM roles? Prep a clear timeline. Highlight depth over breadth if under 5.
Built & launched AI-powered products incl. conversational/chat	Strong	Your RAG knowledge portal is conversational. Frame it as: "I built an AI system users interact with conversationally to query knowledge." Also mention the decision engine (the 90% accuracy model that determines production continue/stop).
Strong technical foundation (software dev, cloud, SaaS)	Strong	Mechanical engineering → physics simulation → AI PM. That's stronger technical depth than most "tech-savvy" PMs. You literally simulated physics.
Cross-functional squad lead in Agile, concept to launch	Strong	0 → 1 with 5 enterprise customers in 5 months. That IS concept to launch and adoption. Lean into this.
Data-driven, product analytics, measurable outcomes	Strong	98% reduction, 90% accuracy, \$150K savings. You have the numbers. Show how you defined these metrics upfront, not post-hoc.
AI quality evaluation & experimentation	Strong	90% accuracy target wasn't random — you had an evaluation framework. Talk about your process for setting quality bars, measuring false positives/negatives, and iterating.
UX-focused, simplify complexity	Strong	Simplified onboarding → accelerated time-to-value. That's exactly what they're asking for.

Stakeholder management, influence without authority	Strong	5 enterprise customers with different needs. Cross-functional team at Oqton. These are stakeholder management stories.
CS/Engineering degree preferred	Strong	Mechanical engineering IS engineering. No gap here.
Fluent English	Strong	Native-level written English in your resume and communications.

⚠ Watch-Outs (Gaps to Address)

Conversational / Chat-based AI experience

The JD specifically mentions "conversational and chat-based experiences." Your RAG portal is the closest fit. **Prepare to frame it as a conversational AI product** — users asked questions in natural language, the system retrieved and synthesized answers. If you have any chatbot or chat interface experience, even internal tools, bring it up. If asked directly about chatbot experience, acknowledge honestly but pivot to the RAG system as your conversational AI work.

Years of PM experience

If you're under 5 years as a dedicated PM, have a narrative ready. Options: (a) your mechanical engineering + simulation work involved product decisions, (b) the depth of your AI PM experience at Oqton is more relevant than generic PM years, (c) SysAid values startup speed over tenure — your 5 customers in 5 months proves you can deliver.

Cloud / SaaS architecture depth

JD asks for "understanding of cloud environments and modern SaaS architectures." Your AI platform is SaaS. Be ready to talk about architecture decisions you were involved in — deployment, scaling, multi-tenancy, data pipeline. Even if you weren't hands-on, show you understand the concepts and collaborated with engineering on them.

🎯 Updated Talking Points (from JD)

1. "Discovery to launch to adoption" — that's your story

The JD uses this exact phrase. Your 0 → 1 at Oqton matches perfectly: you discovered the problem (manual data review), built the solution (AI monitoring platform), launched to 5 enterprise customers, and drove adoption (98% reduction in manual work). Map your narrative to their three-phase model: **Discovery** (customer interviews, understanding the pain) → **Delivery** (model development, integration) → **Adoption** (onboarding, iteration based on feedback).

2. "Stay at the forefront of AI technology"

Show you're current. Mention RAG (your knowledge portal), computer vision (defect detection), decision engines. If you follow AI trends (Claude, GPT, open-source models), mention what excites you about the AI landscape. SysAid is an AI-first company — they want someone who lives and breathes AI, not just a PM who managed one AI project.

3. "Monitor and continuously improve AI performance over time"

This is a specific JD requirement. Have a concrete answer for how you managed model drift, retraining cycles, feedback loops, and accuracy monitoring at Oqton. They're looking for someone who treats AI as a product that needs ongoing care, not a one-time launch.

4. "Experimentation and evaluation approaches to measure AI quality"

This is your moment. Talk about how you defined ground truth for the 90% accuracy model. How did you split training/evaluation data? What metrics mattered beyond accuracy (precision, recall, F1)? How did you decide the model was "good enough" to ship? How did you handle false positives vs false negatives in a production monitoring context?

5. The "Why SysAid" narrative (tighten it)

They're an **AI-first** company in a **mature market** (ITSM) competing with **ServiceNow**. Your narrative: "Legacy ITSM players built for the pre-AI world. SysAid is betting that AI-native architecture wins. At Oqton, I saw the same dynamic — incumbents had feature parity but couldn't match AI-native user experience. I want to bring that thinking to ITSM."
