

I've spent the last several years building AI-powered tools for high-stakes industrial workflows, products where the user can't afford to be slowed down and where a missed signal has real consequences.

At Oqton, I led two products that map directly to this role. With AMVero, our AI inspection co-pilot, I owned the end-to-end experience of surfacing AI detections to quality engineers in real time, achieving 90% detection accuracy while keeping the workflow fast enough that users actually stayed in it. Much of my day-to-day was triaging friction: when users hit issues that broke their flow, I prioritized those above everything else, because a tool people stop using isn't a product.

Before that, I spent three years as the PM for our Simulation product, defining the workflow and experience for engineers making complex, high-stakes manufacturing decisions, owning the product logic, the user journey, and the trade-offs between capability and usability.

The Copilot Experience role is the same problem in a setting that matters more. I'd love to bring what I've learned to Navina.

Best regards,

Michael Korenevsky
